Customer Journey Map

Car Rental Request Automation in ServiceNow

Scenario: Requesting, approving, fulfilling and closing a business car rental request via Service Catalog

Stage	1. Entice	2. Enter	3. Engage	4. Exit	5. Extend	Overall
	How does an employee become aware of the car rental request process?	What does the employee experience when starting a request?	Core moments: approval, task assignment, fulfillment	How does the process finish?	What happens after the rental is complete?	End-to-end experience
Steps	Discovers Catalog item via Service Portal / Intranet / Manager guidance	Opens “Car Rental Request” catalog item → fills dates, locations, duration, car type, reason → Order Now	Manager receives approval → Approves/Rejects → Transport team gets SCTASK → Assigns car & fulfills	Task closed → Request closed → Requester notified of completion	Request history available in My Requests; feedback / re-request possible	Full automated lifecycle from request to closed rental
Interactions	Service Portal / Catalog search; knowledge articles	Catalog form (variables), Order confirmation (REQ/RITM number)	Email / portal approval UI; SCTASK work notes; Transport group queue	Closure notification email; status update on RITM	My Requests list; optional survey / feedback form	Catalog + Flow Designer + Notifications + Portal
Goals & Motivations	“Help me request a car quickly for business travel”	“Help me submit complete details without hassle”	“Help me get approval fast and car assigned on time”	“Help me know the rental is confirmed and ready”	“Help me easily request again or view history”	Reduce manual coordination; transparent tracking
Positive Moments	Clear catalog item name & description; easy to find	Simple form; instant request number; confirmation email	Automated routing; clear approval UI; task appears immediately after approval	Timely closure notification with summary	Full history visible; one-click re-request possible	End-to-end automation; audit trail; SLA visibility
Negative Moments / Pain Points	Unaware of process or wrong catalog item used	Missing mandatory fields; unclear car type options; long form	Manager delay; unclear rejection reason; Transport backlog	No confirmation of actual car assignment details	Hard to find past requests or re-use previous data	Manual follow-ups if notifications fail
Areas of Opportunity	Promote catalog item on intranet; knowledge article with screenshots	Help text & tooltips; dynamic variables; pre-fill from user profile	SLA reminders; auto-escalate approval; car availability check in flow	Include assigned car details in closure notification	“Request again” button; feedback survey after closure	Dashboard for Transport & Managers; continuous improvement via metrics

Key Stakeholders: Employee (Requester), Manager (Approver), Transport / Fleet Team, ServiceNow Administrator

Primary Channels: ServiceNow Service Catalog, Service Portal, Email Notifications, Backend forms (RITM / SCTASK / Approval)

Automation Backbone: Flow Designer (triggered on catalog request) + Business Rules + Notifications + Update Set deployment
